CERTIFICATE

This is to certify that the project report entitled "Smart Text Recognition System (STRS)" which is submitted by Abhishek Kumar, Gulashan Yadav, Aditya Pratap Singh, and Aman, in partial fulfillment of the requirement for the award of degree B. Tech in Department of CSE(AI) of Dr. A. P. J. Abdul Kalam Technical University, Lucknow is a record of the candidates own work carried out by them under my supervision. The matter embodied in this report is original and has not been submitted for the award of any other degree.

Supervisor Name **Dr. Rekha Kashyap**

(Designation) **(Dean, CSE(AI/AI&ML)**

Date:

ACKNOWLEDGEMENT

It gives us a great sense of pleasure to present the report of the B. Tech Project undertaken during B. Tech. Final Year. We owe special debt of gratitude to Mr. Ajay Singh, Department of CSE(AI), KIET, Ghaziabad, for his constant support and guidance throughout the course of our work. His sincerity, thoroughness and perseverance have been a constant source of inspiration for us. It is only his cognizant efforts that our endeavors have seen light of the day.

We also take the opportunity to acknowledge the contribution of Dr. Rekha Kashyap, Dean of the Department of Computer Science & Engineering (AI/AI&ML), KIET, Ghaziabad, for his full support and assistance during the development of the project. We also do not like to miss the opportunity to acknowledge the contribution of all the faculty members of the department for their kind assistance and cooperation during the development of our project.

Date :

Abhishek Kumar (220029152009)

Gulashan Yadav (2200291520078)

Aditya Pratap Singh (2200291520019)

Aman (2200291520028)

ABSTRACT

Abstract— Smart Text Recognition Systems (STRS) have emerged as an advanced solution for extracting and interpreting textual information from images, documents, and real-world environments. Traditional text recognition approaches often face challenges such as low accuracy, poor image quality, variations in handwriting, and lack of contextual understanding. This paper proposes a robust STRS that integrates Optical Character Recognition (OCR), computer vision, and Natural Language Processing (NLP) techniques to enhance accuracy and efficiency.

The system captures input data from images or scanned documents, preprocesses it using image enhancement techniques, and applies machine learning-based OCR models to extract text. Further, NLP algorithms are utilized to analyze and interpret the extracted text, improving readability and contextual understanding. The system is capable of handling both printed and handwritten text across diverse environments.

Experimental results demonstrate high accuracy in text detection and recognition, reduced processing time, and improved performance under varying lighting and noise conditions. The proposed STRS enhances automation, minimizes manual effort, and ensures reliable text extraction for real-time applications.

The findings indicate that STRS is a scalable and efficient solution for modern digital systems, contributing significantly to areas such as document digitization, assistive technologies, automated data entry, and intelligent information retrieval.

Index Terms— Smart Text Recognition, OCR, Computer Vision, Natural Language Processing, Image Processing, Handwritten Text Recognition, Document Digitization, AI-Based Systems, Pattern Recognition, Text Extraction.

CHAPTER 1

INTRODUCTION

1.1 Introduction to the Project

The necessity of extracting and processing textual information in images and documents in the most efficient way has grown tremendously in the recent digital age. Massive amounts of data are available as printed documents, hand-written notes, scanned files and actual images, and manual data entry is time-consuming and prone to errors. The standard text recognition systems are usually characterized by low-quality images, complicated backgrounds, font variations, and the inability to recognize a handwritten text. Such restrictions decrease accuracy and make such systems less usable in the real world.

The system proposed to address these issues is the Smart Text Recognition System (STRS), the high-tech solution, which is based on the combination of Optical Character Recognition (OCR), computer vision, and Natural Language Processing (NLP). The system is to be automatic in detecting, extracting, and interpreting textual information of several input sources including images, scanned documents, and real-time camera feeds. It uses image enhancement and noise reduction to preprocess the input data to enhance recognition accuracy.

Moreover, STRS employs OCR models that are based on machine learning to detect printed and handwritten text with high accuracy. The extracted text is then analyzed using the NLP methods, allowing to understand it better, fix mistakes, and interpret the context. This increases the system reliability and usability.

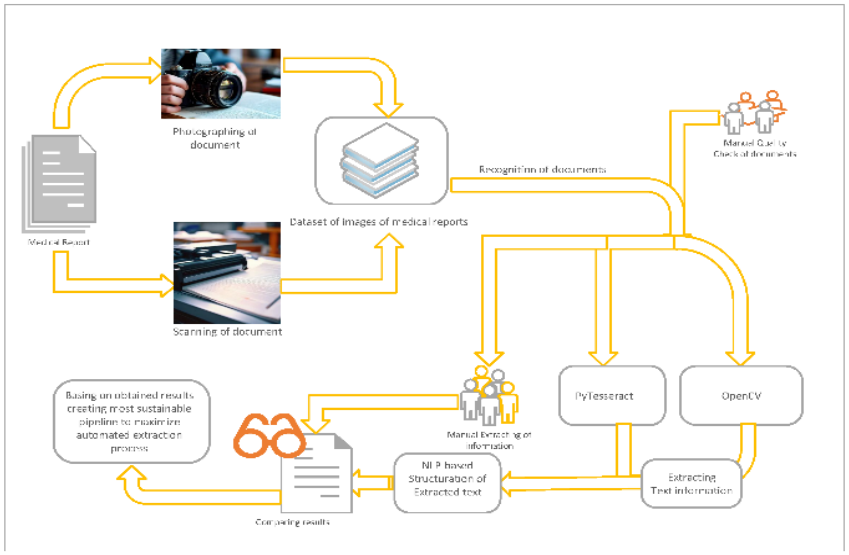

Figure 1.1: Architecture of Smart Text Recognition System (STRS)

This value is a comparison of the conventional manual text processing with the suggested Smart Text Recognition System (STRS). In conventional systems, text is extracted manually and this results in errors, delays and inefficiency. Comparatively, the proposed STRS allows automated text detection and recognition with the help of OCR and NLP, making it more accurate, faster, and reliable.

Table 1.1: Comparison of Traditional Text Processing vs Smart Text Recognition System (STRS)

Feature	Traditional Text Processing	Smart Text Recognition System (STRS)
Data Extraction	Manual and time consuming	Automated using OCR
Accuracy	Prone to human errors	High accuracy with AI models
Processing Speed	Slow	Fast and real-time
Scalability	Limited	Highly scalable
Data Handling	Unstructured and inconsistent	Structured and organized output

1.2 Project Category

The Smart Text Recognition System (STRS) is an AI-based and web-based program that aims at automating the process of extracting and interpreting textual information on images, documents, and real-world data. The system combines various sophisticated technologies including the Optical Character Recognition (OCR), computer vision, and Natural Language Processing (NLP) to achieve effective and precise text recognition. It uses the advanced web technologies and intelligent algorithms to develop a robust and scalable digital solution to automated text processing.

It may be divided into the following domains:

● **Area of Use**: Document Digitization and Intelligent Data Processing.

● **Technical Area**: Artificial Intelligence, OCR, NLP and Web Technologies.

● **System Type**: Multi-user Automated Text Recognition Platform.

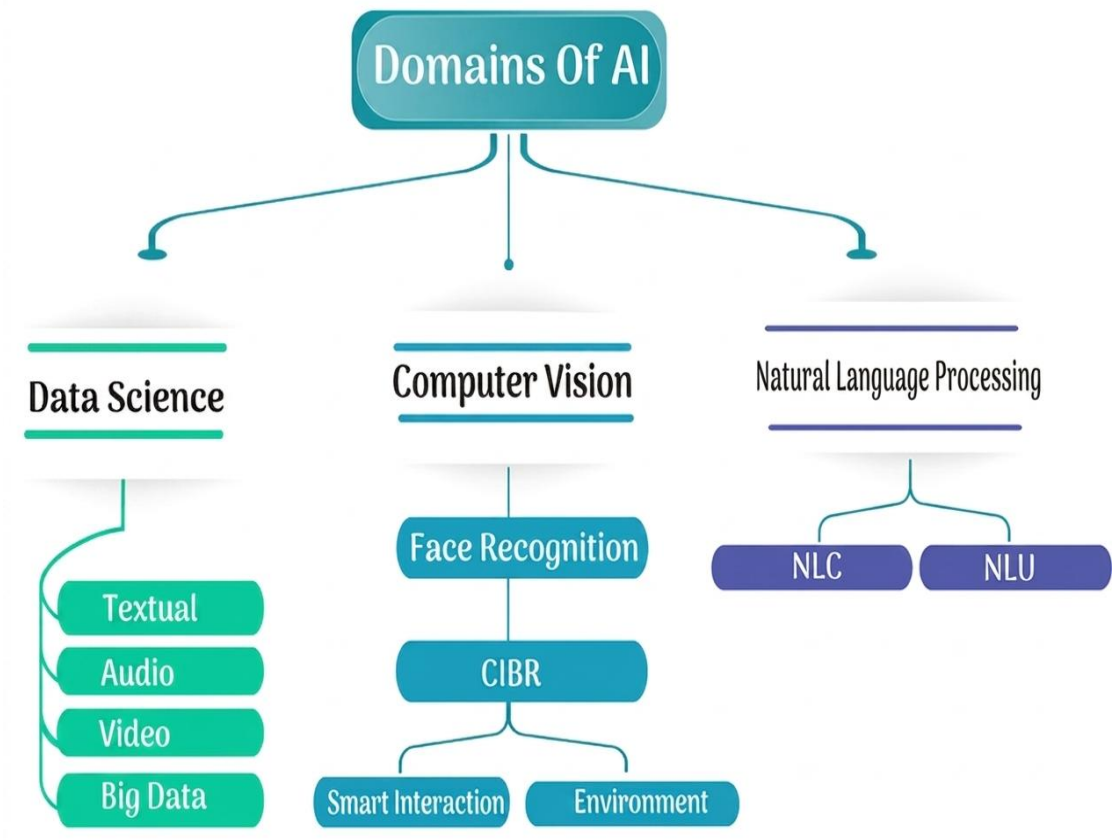

Figure 1.2: Project Domain and Classification Hierarchy of STRS

1.3 Objectives of the Project

The main aim of the **Smart Text Recognition System (STRS)** is to create a smart, precise, and effective system of automated text recognition and identification. The system is supposed to minimize manual labor, increase the speed of processing, and increase the quality of text-based data management in online settings. The specific objectives are as follows:

1. To develop a system that can automatically extract text from images, scanned documents, and real-time inputs.
2. To integrate OCR techniques for accurate recognition of printed and handwritten text.
3. To apply NLP methods for contextual understanding and error correction of extracted text.
4. To improve accuracy and efficiency through advanced image preprocessing techniques.
5. To enable real-time text recognition and processing for faster results.
6. To design a user-friendly interface for easy interaction and document handling.
7. To ensure secure storage and management of extracted textual data.
8. To minimize human effort and reduce errors in manual data entry processes.
9. To build a scalable system capable of handling multiple users and large datasets.

10. To support applications such as document digitization, assistive technologies, and automated data processing.

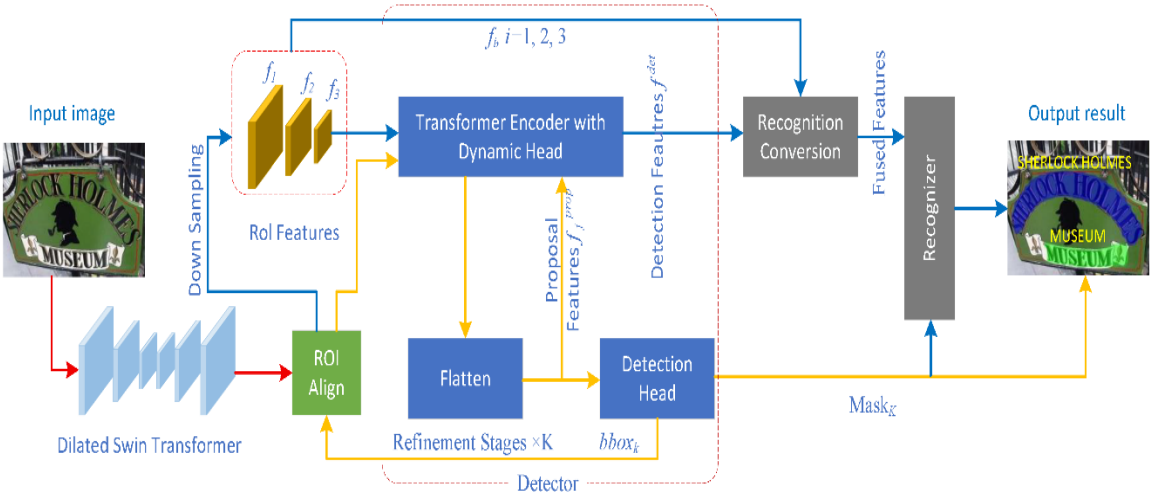

Figure 1.3: Strategic Objectives of Smart Text Recognition System (STRS)

The illustration below presents the strategic objectives of the proposed **Smart Text Recognition System (STRS)** to increase accuracy, reduce the amount of work required for human intervention, improve operational efficiencies, and create a means to intelligently process data through the integration of state-of-the-art technologies including Optical Character Recognition (OCR), Computer Vision, and Natural Language Processing (NLP).

1.4 Structure of the Report

The report is designed in a logical and sequential order so as to clearly define the creation of the **Smart Text Recognition System (STRS).** Each section is designed to provide a clear explanation of the issue being addressed; the proposed solution to address the issue; and how well the proposed solution performs.

Chapter1: Introduction

This chapter introduces text recognition; explains the shortcomings of existing methodologies; creates a problem definition; defines objectives and limits of the study; and provides an overview of the STRS along with its value.

Chapter2: Literature Review

This chapter reviews prior literature regarding text recognition using OCR, computer vision, and NLP-based text recognition systems.

It identifies gaps in prior studies; and it validates the necessity of developing an advanced version of STRS.

Chapter 3: Proposed System
This chapter describes the architecture and workflow of STRS, including modules such as image preprocessing, text detection, recognition, and interpretation.

Chapter 4: Results and Discussions
This chapter discusses system performance, and evaluation results.

Chapter 5: Conclusion and Future Scope
This chapter summarizes the outcomes, advantages, and potential future improvements of STRS.

CHAPTER 2
LITERATURE REVIEW

2.1 Literature Review

A recent study shows the significance of digital technologies used for automatically extracting data and enhancing information processing capabilities in multiple sectors. Recognizing text has been one of the most prominent research fields with growing demand for converting unstructured data from images and documents into structured digital formats. Manual entering of data is a tedious and prone to error process which consumes more time, and hence the Intelligent text recognition systems were developed.

According to various studies on "Optical Character Recognition (OCR)" [6], early systems were primarily limited to recognizing printed text under controlled conditions. However, modern approaches using "machine learning", [3] and deep learning have significantly improved accuracy, enabling recognition of complex patterns, handwritten text, and multilingual content. Researchers have demonstrated that integrating "computer vision", [12] techniques enhances image preprocessing, leading to better text detection and segmentation.

Furthermore, researches in the field of "Natural Language Processing (NLP)" [19], highlight its contribution to better comprehension of extracted text. It assists in correcting errors, understanding meaning, and structuring into a meaningful structure. Studies also state that the system combines "OCR with NLP" [16] to make intelligent and reliable systems for real-world as well.

In general, existing studies have shown that when OCR, "computer vision", [11] and NLP techniques are applied together, they improve text recognition systems performance. Yet, some challenges remain such as dealing with noisy images, font diversity in handwritten text and real time processing efficiency. These gaps highlight the need for a robust and scalable Smart Text Recognition System (STRS).

2.2 Research Gaps

The literature survey shows that there are incredible advancements in text recognition technologies especially OCR, computer vision and NLP. Despite advancements in these technologies that have enhanced the accuracy and speed of text extraction, there are still multiple shortcomings in existing systems. Traditional OCR based solution only recognizes printed text in amiable environments, but they do not generalise well to uncommon issues, like fleecy picture (images with background noise) and many others which include shade shifts, contentions between fonts for instance handwriting.

Currently many systems are split between OCR (to read text) and NLP (Natural Language Processing, for understanding what the text means). Consequently, its output frequently needs manual correction and validation. Also, diverse platforms missing to facilitate real-time processing, limiting these systems for dynamic applications like live text recognition from digital cameras.

These research gaps have been identified based on the literature review:

- Poor performance on noisy text and handwritten inputs.]
- OCR and NLP are not combined for context understanding.]
- No real-time text processing capabilities.
- Unsatisfactory scalability for working with high data volumes \
- No secure and structured data storage systems.

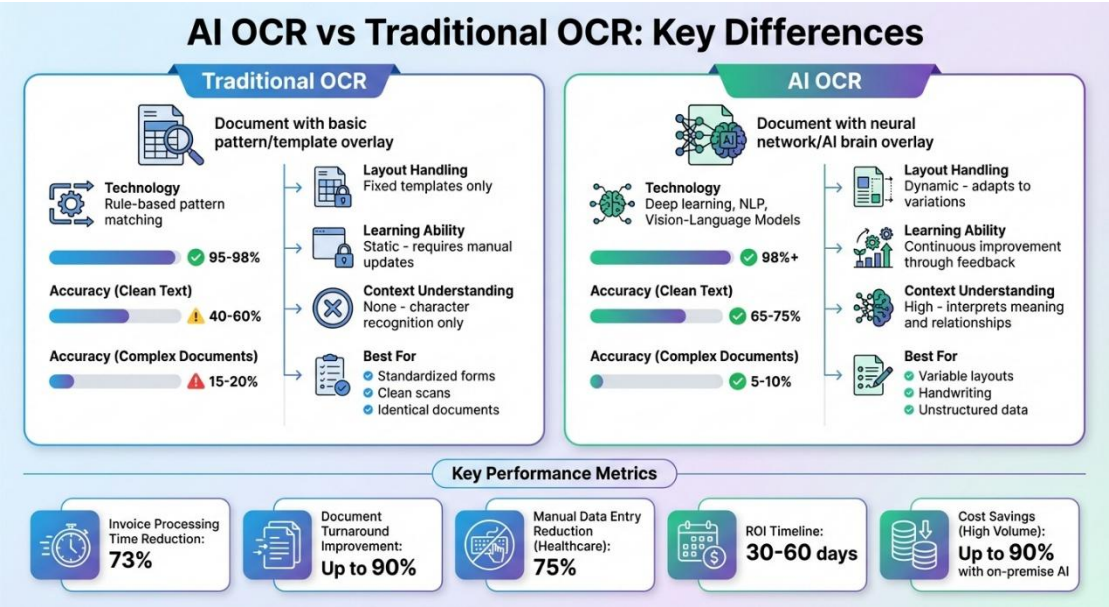

Figure 2.1: Comparison of Existing Systems vs Proposed Smart Text Recognition System (STRS)

This image shows comparison between conventional text processing methods and Smart Text Recognition System (STRS). Traditional methods of extracting text in existing systems rely on manual procedures or rudimentary optical-character-recognition (OCR) technologies that introduce errors, are slow and do not understand the context. Traditional techniques have difficulty when faced with complex types of data, such as messy handwriting, low-quality images and fluctuations in lighting conditions. Moreover, they do not integrate advanced technologies where automation of data becomes limiting.

This contrasts with the preliminary STRS as it integrates OCR, computer vision and NLP into a single digitized platform avoiding its limitations. The system offers

automatic text detection, extraction and interpretation which provides higher accuracy, faster processing and better reliability. Hub Provides Real-Time Processing: Hub enables continuous, real-time processing of complex event data streams and provides structured output in a unified format that can easily integrate with other systems. This reduces reliance on manual labour and improves transparency, efficiency and scalability for text recognition tasks.

2.3 Problem Formulation

A large amount of text-based information in various formats - images, scanned documents and handwritten notes, for example - exists. Despite this, extracting meaningful information from these sources continues to be a daunting challenge. The efficiency of traditional text recognition methods, meanwhile, is often compromised. They require considerable manpower and are also error-prone to a large extent. Things like low image quality, complex backgrounds, and handwriting inconsistencies all further decrease existing systems' accuracy.

The problem can therefore be formulated as:

How can a system be developed that accurately extracts, processes, interprets text from a variety of real-time sources and ensures high accuracy, scalability, and structured data output efficiently?

Table 2.1: Identified Problems in Existing Text Recognition Systems

S.No	Identified Issue	Description	Impact
1	Low Accuracy	Difficulty in recognizing complex or noisy text	Incorrect data extraction
2	Limited Handwriting Support	Poor performance on handwritten text	Reduced usability
3	Lack of Context Understanding	No NLP integration for meaning extraction	Unstructured output
4	Poor Image Handling	Inability to process low-quality or distorted images	Recognition errors
5	Manual Dependency	Requires human verification and correction	Time-consuming process
6	No Real-Time Processing	Delayed text recognition and output	Reduced efficiency

7	Limited Scalability	Cannot handle large datasets or multiple users	Performance issues
8	Weak Data Management	Lack of secure storage and structured output	Data inconsistency

CHAPTER 3
PROPOSED SYSTEM

3.1 Proposed System

Because the Smart Text Recognition System (STRS) was executed with success, a high-functioning digital stage for pulling out and organizing written facts from visual captures and official papers was created. Many people believe that the Smart Text Recognition System (STRS) operates through a structural framework composed of separate parts, which makes the work of keeping the Smart Text Recognition System (STRS) in good condition much easier. Every single component within the Smart Text Recognition System (STRS) is built to do one particular task, and this design allows the whole Smart Text Recognition System (STRS) to join together without trouble while keeping the sequence of labor very smooth. Experts claim that the Smart Text Recognition System (STRS) achieves high quality because the internal arrangement is logical.

1. Intelligent Text Processing and Analysis

Machine learning provides the base for OCR models, and these OCR models identify characters from both printed documents and handwritten notes. Many people believe that OCR models bridge the gap between physical paper and digital data. A recognition process is performed by the machine learning algorithms.

When the text is captured, NLP begins the analysis of the information. Experts claim that NLP increases the quality of the findings. A higher level of accuracy is achieved by NLP when NLP cleans the data.

• NLP corrects spelling mistakes and grammatical errors
• NLP understands the context and the actual meaning
• NLP organizes data into structured formats
• NLP enables keyword extraction and summarization The functional value and reliability of the information become stronger because NLP finishes the processing steps.

This improves the usability and reliability of the extracted information.

2. Overall System Benefits

The proposed STRS provides several advantages:
• High accuracy in text recognition
• Reduced manual effort and human errors
• Faster processing and real-time results
• Improved scalability and system performance
• Enhanced data organization and accessibility

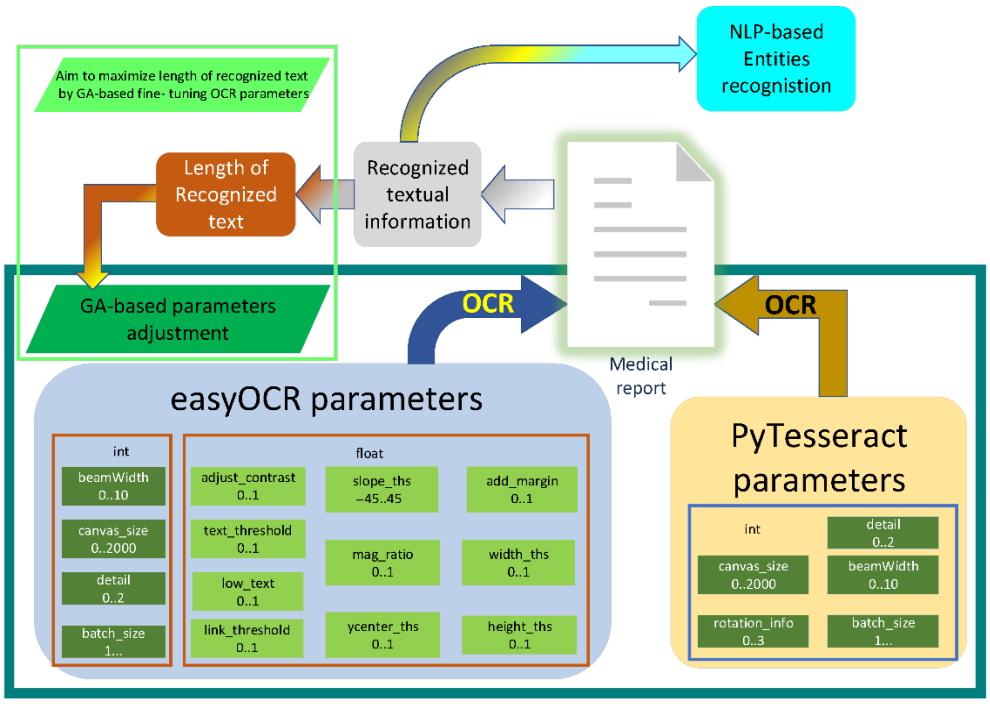

Figure 3.1: Architecture of the Proposed Smart Text Recognition System (STRS)

This figure illustrates the overall architecture of the proposed **Smart Text Recognition System (STRS)**. The system is accessed through a python GUI interface where users can upload images, scanned documents. The application server processes user requests and manages the flow of data through different modules such as preprocessing, text recognition, and analysis.

Table 3.1: Modules of the Proposed Smart Text Recognition System (STRS)

Module Name	Description	Technology Used	Function
User Interface Module	Provides interaction interface for users	Python (GUI)	Enables users to upload images and view results
Image Processing Module	Performs preprocessing on input images	OpenCV	Enhances image quality for OCR
Text Extraction Module	Extracts text from images	Tesseract OCR	Converts image text into readable text

Output Module	Displays extracted text to users	Python	Shows processed text output

3.2 Unique Features of the System

The **Smart Text Recognition System (STRS)** introduces several unique features that distinguish it from traditional text processing and basic OCR systems. These features enhance accuracy, efficiency, automation, and user experience while enabling intelligent data handling and real-time processing.

1. Advanced OCR with AI Integration

STRS benefits from the advanced Optical Character Recognition (OCR) integrated with machine learning capabilities, which are particularly useful in inverter applications. The proposed system as opposed to classical OCRs:
• Accurately recognizes both printed text and handwriting.
• Deals with complex fonts, layouts, and multilingual content.
• Enhances productivity with models that learn continuously
• Reduces errors in text extraction

2. Context-Aware Text Processing using NLP

The inclusion of Natural Language Processing (NLP) will help to interpret the extracted text :
• Fixes misspelled words and grammatical errors.
• Comprehends the meaning and context.
• It puts together data in order to form meaningful formats.
• Summarisation and keyword extraction made easy.

3. Intelligent Image Preprocessing

The system uses computer vision techniques to improve input quality before recognition. It includes:
• Noise reduction and image enhancement
• Skew correction and segmentation
• Handling low-light and distorted images

This significantly improves recognition accuracy.

CHAPTER 4

RESULTS AND DISCUSSIONS

4.1 Description of Modules with Snapshots

The successful implementation of the system led to the development of a smart platform that can extract process and manage text from images and documents. The system is built in a modular way of functioning which makes it easy to maintain. Each of their modules is made in a way that they perform a separate function and works smoothly.

4.1.1 User Interface Module

The UI Module is the main point of contact between the STRS and its users. This platform presents a user-friendly interface, with simple navigation that allows easy handling of different tasks. This module's main functionalities include:

• Upload images or scanned documents to recognize text.
• Seeing text output that is extracted and processed.

The UI module is crucial for ensuring the ease of use of the components. It serves to verify the accuracy of user inputs in order to eliminate errors and making the process more efficient. The design of the interface helps to operate the system smoothly without any technical knowledge.

The pictures of this module showcase a neat dashboard with options to upload files, display results etc. The design focuses on the efficiency and simplicity of the system's operations and user activities.

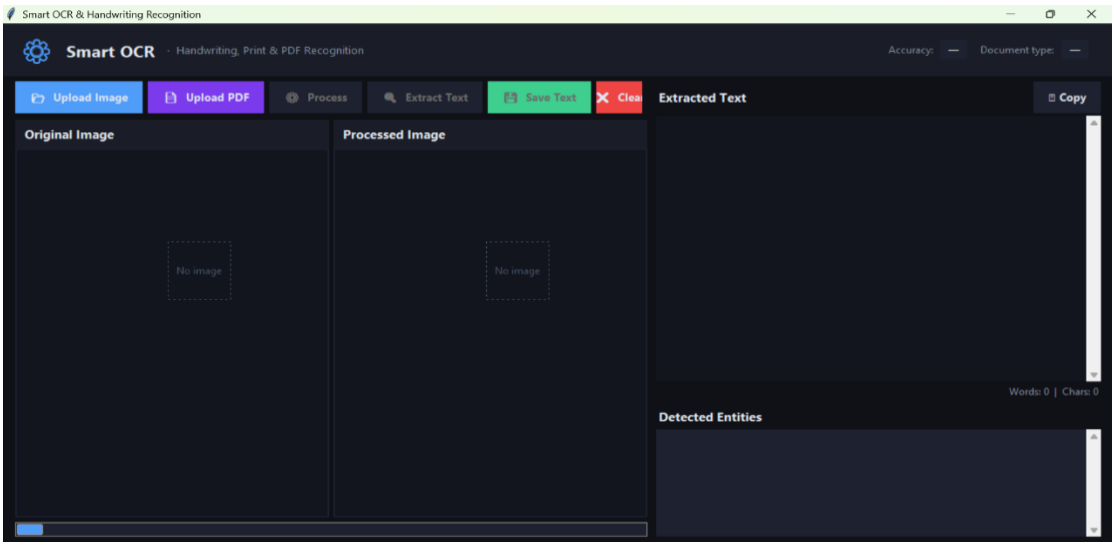

Figure 4.1: User Dashboard Interface of Smart Text Recognition System (STRS)

The interface enables users to upload images, and view extracted text results. It serves as the primary point of interaction between users and the Smart Text Recognition System (SRTS) platform.

4.1.2 Text Processing Module

The module's function is to extract text from documents and images as well as perform processing; therefore, its output will consist of the extraction of text (i.e., it uses Optical Character Recognition (OCR) to generate text outputs for processed documents/images) as well as the use of Natural Language Processing (NLP) techniques to produce logical/sensible text (i.e., meaning) following the extraction process.

The module provides:
• accurate text extraction using OCR
• improved accuracy and efficiency

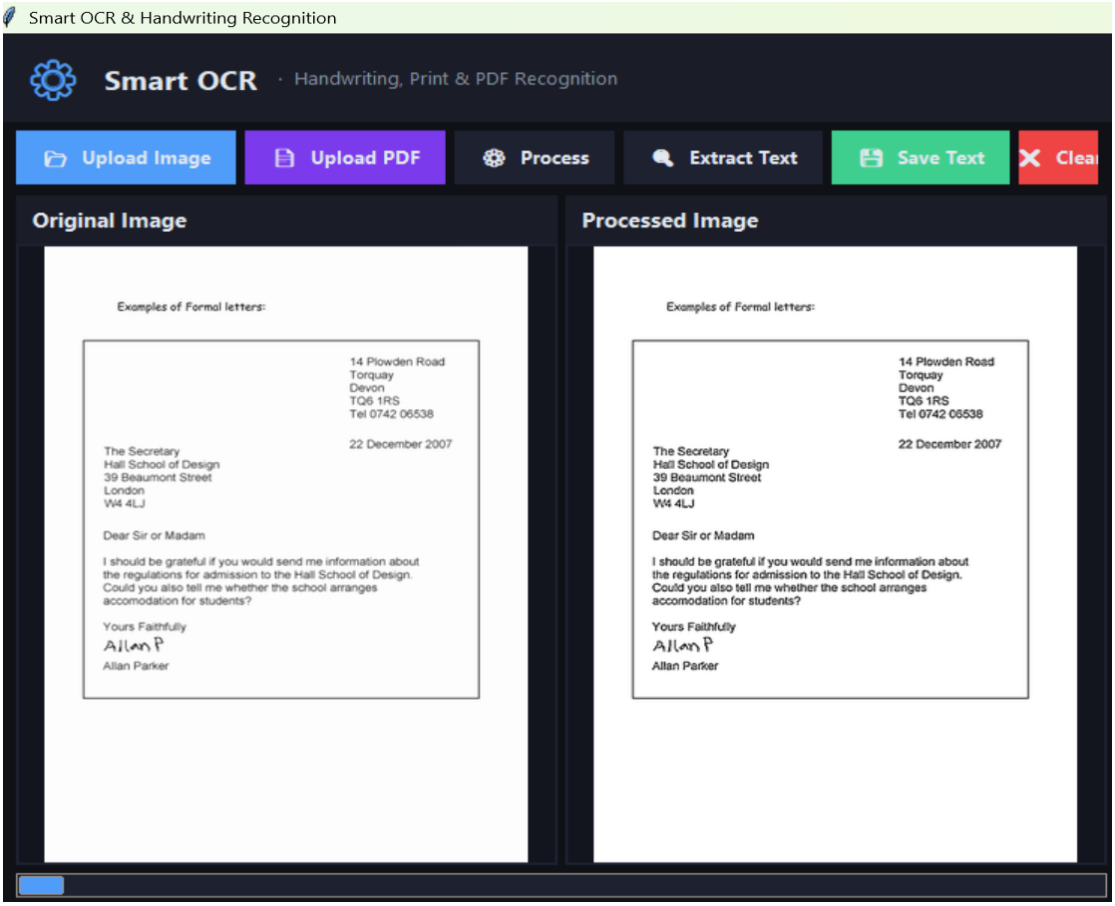

Figure 4.2: Text Processing of Smart Text Recognition System (STRS)

The interface enables users to upload images, and track text extraction results. It serves as the primary interaction point between users and the **Smart Text Recognition System (STRS)**, ensuring smooth and efficient operation.

4.1.3 Output and Monitoring Module

The Output & Monitoring Module provides a way for the user to view, monitor, and track their text recognition results in real-time. After processing your input image or document, the system will show you the extracted and processed text immediately after processing.

The Output & Monitoring Module includes:

• Real-time display of the extracted text results

The Output & Monitoring Module enhances the user experience by providing quick feedback. Immediate feedback helps users coordinate their input to output stages to verify their results.

Overall, the Output & Monitoring Module improves efficiency, accuracy, and the ability to usability of the STRS system. Thus, the Smart Text Recognition System (STRS) is more reliable and effective.

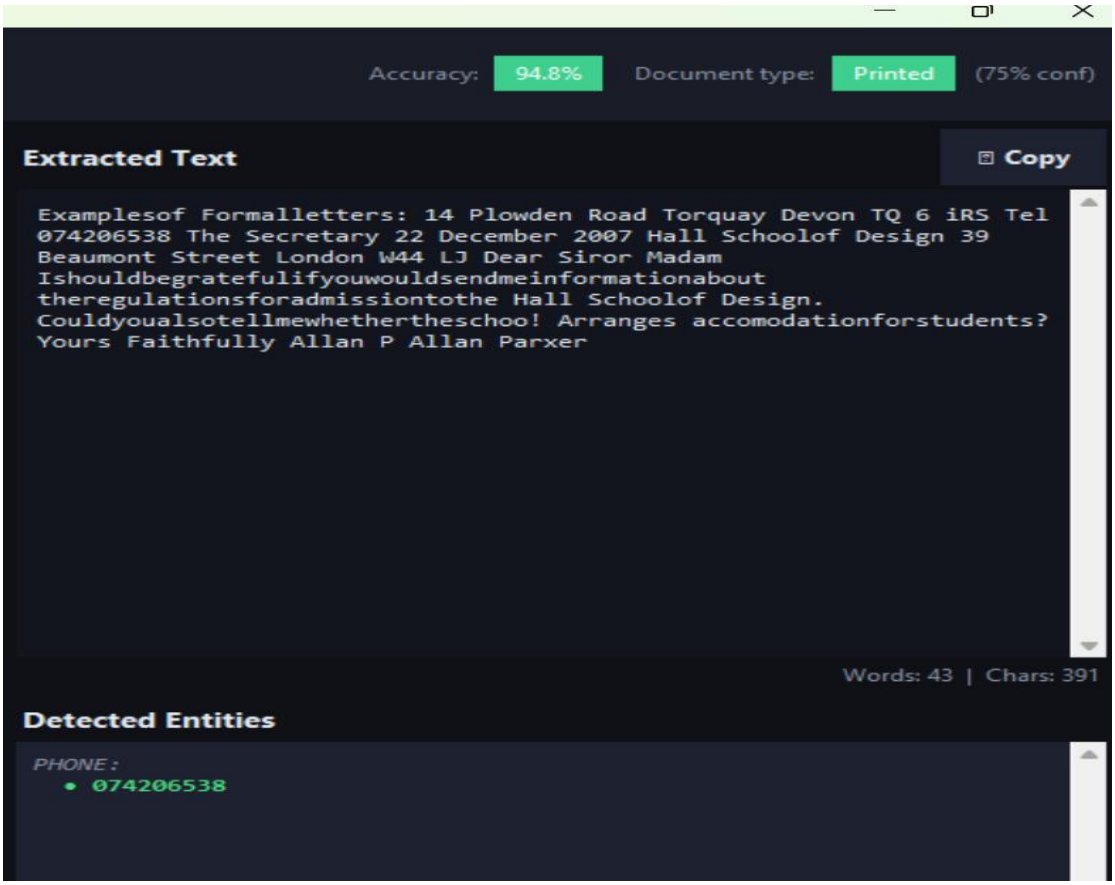

Figure 4.3: Output Monitoring Interface of Smart Text Recognition System (STRS)

The user interface allows users to upload images, track text extraction progress and processing status. Users can also track performance views of their extracted text.

4.2 Key Findings of the Project

Key findings from the STRS design and implementation phases include:

1. Combining image processing and OCR into one system has improved the coordination of separate steps in the processing chain.
2. Automating the text extraction process has resulted in more accurate results, while requiring less human effort than traditional manual data entry methods.
3. Users can effectively work with printed and handwritten text, making the system very useful for a variety of applications.
4. The modular architecture allows for system maintenance and future enhancement by making it easy to adapt the components as needed.
5. By automating the process, time to complete tasks has decreased significantly and eliminated repetitive manual tasks, resulting in greater overall productivity.

These findings show that STRS provides a viable, dependable, and effective solution and increased both the accuracy of the text extraction process and the efficiency of the overall workflow.

Table 4.1: Document Processing Details Table (STRS)

File name	Document Type	Accuracy
Letter.jpg	Printed	94.8
Notes.jpg	Handwritten	94.2

This table contains details of processed text data generated by the **Smart Text Recognition System (STRS)**, including document type. It helps users view text extraction results efficiently.

The information enables users to view extracted text.

Additionally, the table show text extraction results.

Overall, this enhances usability.

CHAPTER 5
CONCLUSION AND FUTURE SCOPE

5.1 Conclusion

It includes attributes such as document type. The system processes input images and extracts text. The extracted text is displayed to the user. This ensures simple and efficient text recognition.

The system is designed so that the results from processing a user's inputs can be easily read by the user. Each of the results from each input (i.e., images) includes detailed information about what type of document it was created with and whether the text in it was typed or written.

An important part of this project was to have a way to get the text out of an image. Getting the text out of an image increases both the reliability of the overall system as well as its accuracy. The system will provide feedback to the user on what happened with the text extraction.

The system presents results of processed text from inputted images. The user is able to see the extracted text that has been processed from their inputs. This allows users to be able to quickly identify the outputs from the processed images. Additionally, this will allow users to have an easier time interacting with the system because of its simplicity. The system presents extracted text from images entered into the system. Each image enters as part of a process through the system, thus allowing the user to be able to view the output from the images they enter. Users are also able to determine if there was successful extraction of text or not by viewing the extracted text. Overall, the simple way that the extracted text is presented allows for better usability within the system.

The Smart Text Recognition System (STRS) has demonstrated its ability to successfully extract text from image formats, displaying results in a easily readable and understandable format. Image processing is completed at a high efficiency with accurate text outputs; thus allowing users to quickly verify the validity and interpret extracted content. The STRS recognizes both handwritten and printed text formats; this greatly enhances usability and allows for a wider array of users for this project. STRS also features a straightforward and easy to use interface for users, which will allow for effortless interaction and is available for all users regardless of computer skills/technical abilities. Overall, the STRS provides an effective and reliable text recognition solution that produces improved accuracy and efficiency in the recognition process and decreases the amount of manual work performed by individuals processing textual information.

The Smart Text Recognition System (STRS) is an effective way to convert image-based text into readable digital format. The STRS can process input documents and provide extracted images of text in a simple and clear manner, enabling users to understand the output quickly and easily. The STRS is fully capable of recognizing both printed and

handwritten text; this greatly increases the system's usability across different applications. STRS also emphasizes on providing a simple and efficient user interface, thus allowing users to have ease of use when accessing the STRS system, regardless of their technical ability. Overall, the project demonstrates an effective approach for performing text extraction from images, ultimately increasing productivity and decreasing the amount of manual data entry completed.

5.2 Future Scope

The Smart Text Recognition System (STRS) is an innovative text recognition tool that offers numerous opportunities to enhance its performance and capability. Expanding the number of languages supported by the STRS will make it more useful to an international audience. Additionally, enhancements to the algorithms used for text recognition will lead to more accurate and efficient recognition of both handwriting and complex printed text. Improvements to the STRS's user interface will create an interactive experience that makes it more user friendly. Integration of STRS into mobile devices, such as smart phones and tablets, will provide users with convenient options for using the system from different locations.

Future enhancements to STRS could include the ability to read more than one page at a time. Additional features may provide users with the ability to download text to other formats (e.g., PDF or .txt). Initial spell-checking functions are also possible enhancements, allowing the system to correct some errors when processing input. Increasing processing speed will improve the overall performance of the system. These enhancements will work together to create a more functional and convenient product.

APPENDIX 1

RESEARCH PAPER

The Research Paper Title "Smart Text Recognition System (STRS)" has been Prepared For submission to a peer-reviewed or IEEE conference. The paper proposes a smart text recognition system that integrates computer vision–based preprocessing, OCR techniques, and natural language processing to accurately recognize printed, handwritten, and scene text in real-world conditions.

to me

Dear Author(s),

We are pleased to inform you that your Manuscript
"Smart Text Recognition System Using Hybrid CNN-Transformer Architecture" has been accepted for presentation at ASSIC 2026.

ASSIC 2026 once again congratulates you on the acceptance of your research paper.

Dear Gulashan Yadav, Abhishek Kumar, Aditya Pratap Singh, Aman, Ajay Singh, Mukesh Kumar Tripathi

We are pleased to inform you that your paper has been successfully accepted for presentation at the *International Conference on Intelligent Methods and Advanced Computer Scientific Innovations (IMACSI-26)* following a rigorous peer-review process.

Paper ID: IMACSI - 174

Paper Title: Smart Text Recognition System (STRS)

Date of Acceptance: 24.04.2026

Your paper has been evaluated by the Technical Review Committee and found suitable for publication and presentation. Kindly ensure that all reviewer-suggested corrections (if any) are incorporated into the camera-ready version before final submission. The official camera-ready template will be shared with you shortly.

Review Comments:

- The proposed STRS framework is relevant and technically strong, but the manuscript requires major language correction and grammar refinement for better readability and academic quality.
- Experimental results are promising, however comparison with recent benchmark OCR models and clearer dataset implementation details should be added to strengthen validation.

Important Notes:

- The final camera-ready paper must be submitted as per the official conference template before the specified deadline.
- (IMACSI-26) proceedings are planned for indexed in Scopus-indexed outlets (as per conference policy and publisher confirmation).
- At least one author must register and present the paper at the conference for inclusion in the final proceedings.

PLAGIARISM REPORT

Ajay Singh
